

# Individuals should be held responsible for mature material created by AI

Group C

A dark blue diagonal gradient bar that starts from the bottom left corner and extends towards the top right corner, covering the lower half of the slide.

# AI is always operated by people and does not have personal agency

- AI operates within the boundaries of the **Rules** and **Orders** in the form of **PROMPT**
- It **does not do** anything **that is not given** to it as a rule or order.
- Responsibility should be imposed on the **INDIVIDUALS** that gives the rule or order to the AI
- Fair responsibility while encouraging to exercise **caution** and **ethical considerations**

# Platforms can monitor the users and impose guidelines, but in the end the creator of the content is responsible for their actions

A

Platforms can watch user-generated content and modify AI to prevent rule-breaking content, but accurately identifying prohibited AI-generated content is difficult, so individual accountability is important for understanding intent and context.

B

Without individual responsibility and the risk of punishment, there is no motivation to follow platform guidelines or laws, thus emphasizing individual accountability ensures that creators bear the ultimate responsibility for their actions, although platforms can still aid in policy enforcement.

# User responsibility promotes ethical use of AI

Accountability encourages ethical behavior and promotes responsible use of AI technology. When individuals know they will be held accountable for the content they create, they are more likely to consider the potential consequences and adhere to ethical guidelines.

# Will curb mainstream Innovation and user experience

If the whole responsibility of mature content falls on the shoulders of **platform**, they will become **overly cautious** and restrict themselves in further development. Also, this will hinder competition of mainstream platforms and give rise to more dark-web like entities spawning out.

Further very restrictive nature of platform will **hinder user experience** as individuals will need to jump through many hoops implemented by platform, especially with rudimentary ability to judge yet phenomenal speed to generate content in the heavily **grey area** for determining what's mature content

# Rebuttal

## AI is always operated by people and does not have personal agency

- Team B said: Platforms oversee the AI *because* the AI does not have sentience and cannot self-moderate, so the platforms should be held accountable for content generated
- Response:*because* the AI does not have sentience and cannot self-moderate so AI acts on INPUT that it gets, so the entity giving the orders and input should be responsible. Platform responsibility is not enough because the intent of the created content is not always clear, so by looking at the individual case we can impose personal responsibility.

## Questions:

- Platform responsibility only works for preventative measures. When something actually goes wrong, individual personality is needed. So if the guidelines don't work: so if someone uses your picture to create a deepfake for sexual content, and the victim sues, should they sue the platform?
- Are there any situations where the platform would fully take the responsibility and it would not have anything to do with the individual? How would this be realistic?
